

How Houston compares

Houston scores 46 out of 100 and ranks 7th of the 11 host cities. The score compares how much energy, water and food carbon a typical shop uses here in summer, plus how hot the city gets, against the other host cities. The best of the 11 gets 100 and the worst gets 0, so the score shows where a city stands, not whether it passes a fixed target.

Readiness score, all host cities (higher is better)

What stands out

Compared with the other host cities, Houston is well above average on summer cooling need and about average on energy use, water use, food carbon and urban heat.

Top 3 steps for Houston

These come from the intervention lab. No single resource stands out for Houston, so they are ranked by their biggest cut. Each percent is the share of the city's whole summer total that the step saves.

1. Hotel water programme

Hotels put the "hang up your towel" card in rooms, and grants pay for low-flow showerheads, tap aerators and low-flush toilets.

Who does it: Hotel association + water utility. Cost: \$\$, about \$100k a hotel, pays back in 2 years.

Saves about 0.8% of energy and 5.4% of water.

2. Kitchen water retrofits

City pays part of new spray valves, dishwashers and ice machines for restaurants.

Who does it: Economic development + water utility. Cost: \$, \$21 to 88 a spray valve, pays back in months.

Saves about 0.3% of energy and 1.9% of water.

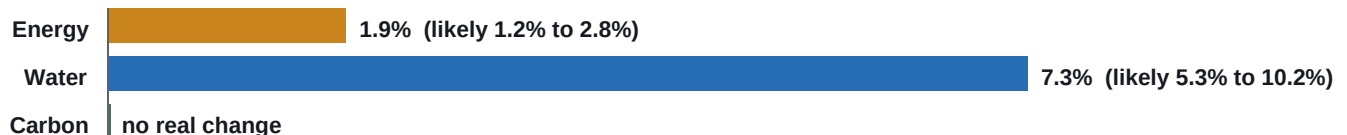

3. Kitchen energy retrofits

City pays part of efficient fryers, ovens, fridges and smart exhaust hoods for restaurants.

Who does it: Economic development + utility. Cost: \$\$, per-appliance grants, programme cost not pulled.

Saves about 0.9% of energy and 0.2% of water.

If Houston does all 3: cut to the city's summer total

The bar is the middle estimate. The range in brackets covers 8 in 10 simulated outcomes.
