

How San Francisco Bay Area compares

San Francisco Bay Area scores 98 out of 100 and ranks 3rd of the 11 host cities. The score compares how much energy, water and food carbon a typical shop uses here in summer, plus how hot the city gets, against the other host cities. The best of the 11 gets 100 and the worst gets 0, so the score shows where a city stands, not whether it passes a fixed target.

Readiness score, all host cities (higher is better)

What stands out

Compared with the other host cities, San Francisco Bay Area is well above average on urban heat, below average on water use and well below average on energy use, food carbon and summer cooling need.

Top 3 steps for San Francisco Bay Area

These come from the intervention lab. No single resource stands out for San Francisco Bay Area, so they are ranked by their biggest cut. Each percent is the share of the city's whole summer total that the step saves.

1. Hotel water programme

Hotels put the "hang up your towel" card in rooms, and grants pay for low-flow showerheads, tap aerators and low-flush toilets.

Who does it: Hotel association + water utility. Cost: \$\$, about \$100k a hotel, pays back in 2 years.

Saves about 0.7% of energy and 4.8% of water.

2. Kitchen water retrofits

City pays part of new spray valves, dishwashers and ice machines for restaurants.

Who does it: Economic development + water utility. Cost: \$, \$21 to 88 a spray valve, pays back in months.

Saves about 0.2% of energy and 1.9% of water.

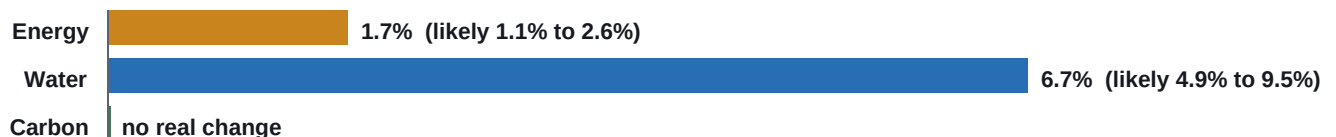

3. Kitchen energy retrofits

City pays part of efficient fryers, ovens, fridges and smart exhaust hoods for restaurants.

Who does it: Economic development + utility. Cost: \$\$, per-appliance grants, programme cost not pulled.

Saves about 0.8% of energy and 0.2% of water.

If San Francisco Bay Area does all 3: cut to the city's summer total
